Aim of the project

Compute the connectivity to the cosmic web of the clusters

Do clusters properties derived from the optical (richness) and X-ray (temperature) depend on connectivity ?

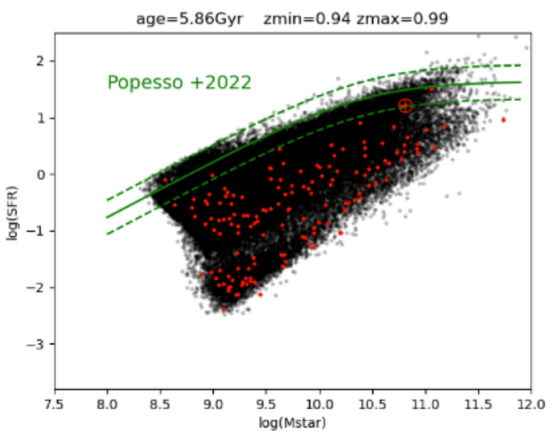
What is the relation between connectivity and dynamical state ?

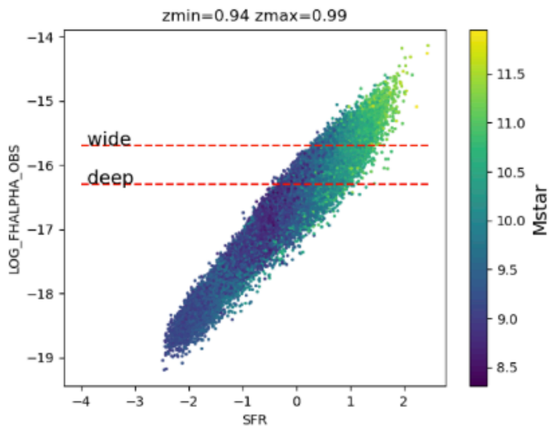
Internship project will be carried out by **Edgar Vidal** in the next two months.

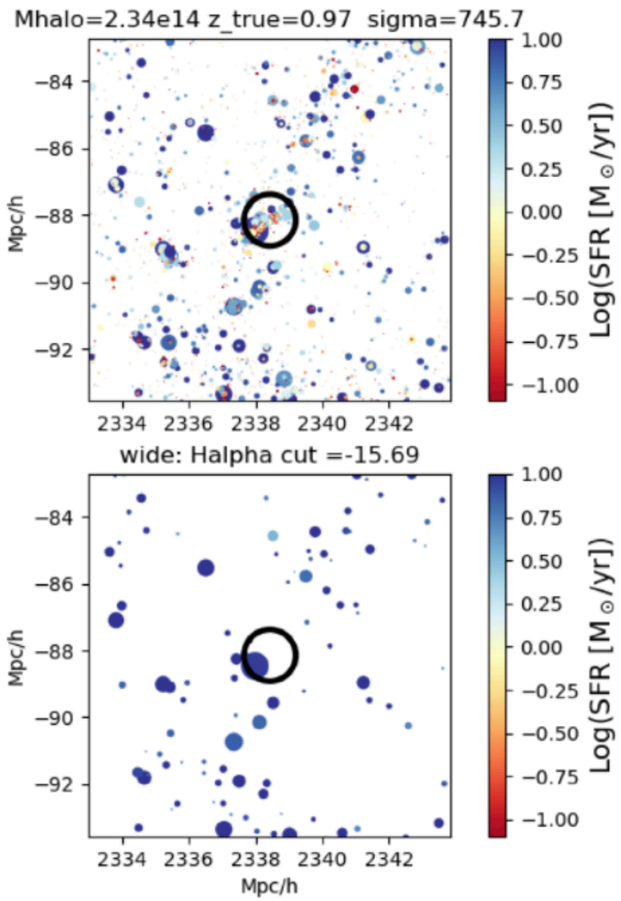
Extend this type of analysis to higher redshift with Euclid ?

The Euclid survey will cover 15,000 deg^2 with photometry in visible and near-infrared bands

Billions of galaxies — 30 million with spectroscopic redshifts at $0.9 < z < 1.8$







Credit: Pasacle Jablonka (Geneva)

Hα selected galaxies are mostly star-forming i.e. may not be as good a tracer of the cosmic web compared to SDSS LRG sample

Work in progress inside the Euclid consortium in collaboration with K. Kraljic, C. Laigle, U. Kuchner et al.
