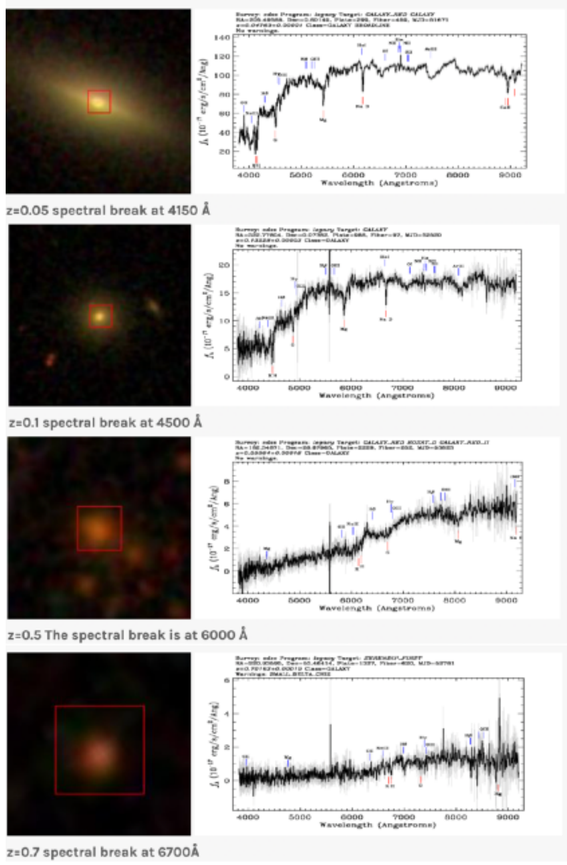
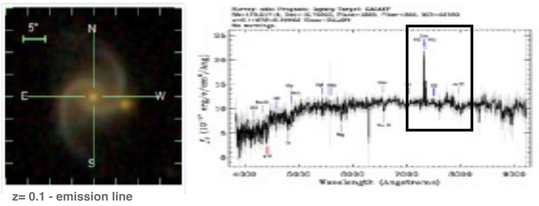
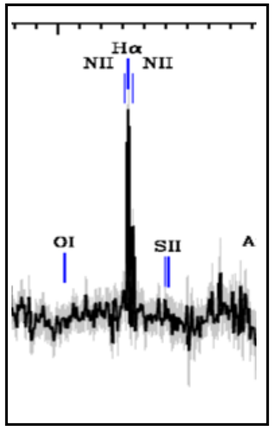
Estimate of galaxy distances

- Measure the redshift z of the galaxies, which to first order is a distance estimate



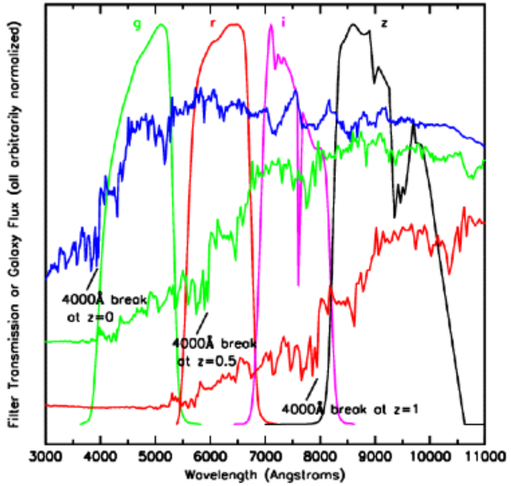
As observed flux decreases with redshift, getting a measurement get increasingly harder

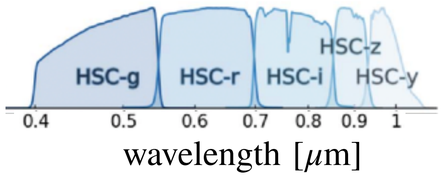


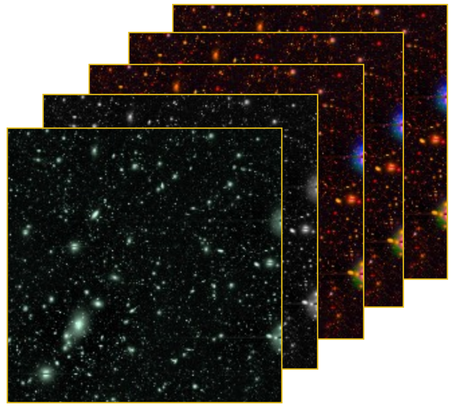


Emission line galaxies can be detected at higher redshift

→ *Euclid*







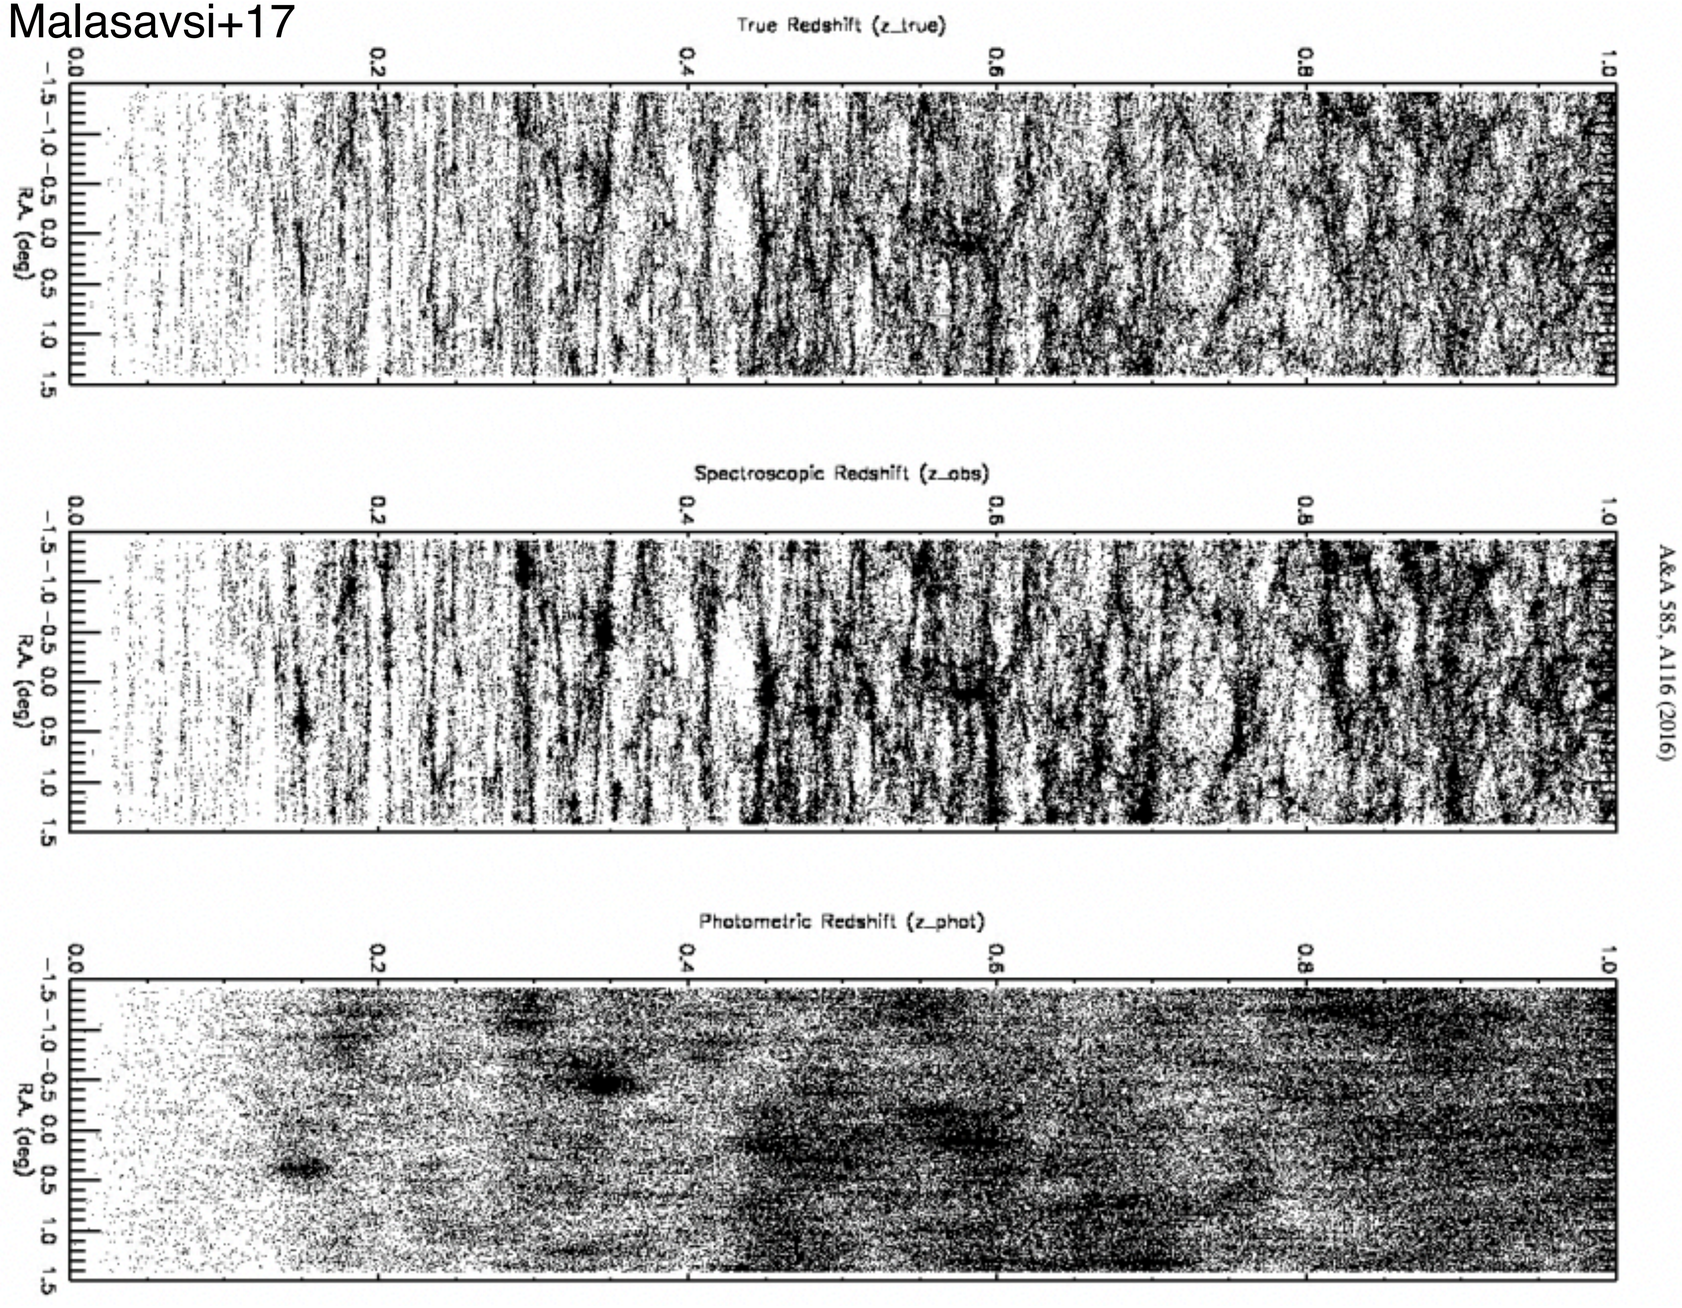
Multiband photometric observations

Very low resolution, integrated spectrum.

Important uncertainty on redshift (5-10 %)

The effect of redshift measurement uncertainties

Malasavsi+17



A&A 585, A116 (2016)

Uncertainties + peculiar velocities smear out the spatial distribution
